

You can help the birds!

Morecambe Bay is a great place for you to see and enjoy birds.

Please avoid disturbing the birds by keeping your distance as they feed, rest and nest. Here's why:

-  **Birds need to feed up to survive,** thrive and fuel their long-distance flights. If a bird stops eating or raises its head please move away.
-  **Birds need rest** (known as roosting) during high tide. They use 12 times more energy when they fly, so please leave them in peace.
-  **Birds can easily be scared by dogs.** Keep your dog on a lead and well away from them.
-  **Keep your impact on wildlife to a minimum** by staying on Public Rights of Way or permissive paths as waders and wildfowl nest and rest on the ground.
-  **Don't forget to tell your friends and family about the birds of the Bay.** Together we can protect the birds and other wildlife of the Bay.

For more info visit morecambebaycoastalcode.org

Sponsored By

Morecambe Bay is the largest intertidal area in the UK and is internationally important for its habitats and species. The Bay has the maximum level of legal protection for its wildlife because it is one of the top three places in the UK for shorebirds.

 **Morecambe Bay Partnership**

Morecambe Bay Partnership is the only charity solely dedicated to championing Morecambe Bay.

We raise funds to help protect the nature, heritage and natural environment of this special place and to bring about investment in improved skills, health and wellbeing everyone.

Bird Jargon Buster

High tide roost - A place where birds come together to rest or sleep at high tide.

Intertidal - The key feeding area between low and high tide.

Mudflat - A stretch of mud uncovered at low tide.

Saltmarsh - An area of grassland that is regularly covered by seawater.

Skear - A rock or mound of cobbles in the sea.

Wader - Birds that live in coastal environments with long legs that allow them to wade through water.

Wildfowl - Birds such as ducks, swans and geese.

Species such as Lapwing and Curlew are endangered. We are very lucky to have these birds sharing our coastline. To help them survive and thrive they need space, a safe, healthy environment and protection. Please help them by keeping your distance, keep dogs on leads and put your litter in bins or take it home.

Brilliant for birds

Morecambe Bay makes the perfect pit-stop for migrating birds. They travel thousands of miles from the Arctic regions during the colder months and stay for days, weeks or months to feed on the millions of creatures that live in the mud, sand and saltmarsh.

Vast mudflats and sands, and rocky skears are covered and uncovered twice-daily by the Bay's high tides. Low tide reveals a rich abundance of food for birds. At high tide the Bay provides safe spots, such as saltmarshes, piers and jetties, for birds to gather and rest. Morecambe Bay supports over 210,000 individual birds, and is listed in the top three sites in the United Kingdom for wintering waders and wildfowl.

To find out more about waders and wildfowl visit the Birds of the Bay webpage at morecambebay.org.uk/birdsofthebay

Bay Bird Bingo

When to see the birds of the Bay

The birds you see will depend on the tide, the time of day and time of year.

You can often see birds:

- Resting on their roost sites during high tide
- Feeding where the water ebbs and flows, for two hours before and after high tide

We all enjoy the Bay. Please take care not to disturb the birds when you're having fun, exercising or relaxing.

Check off these birds when you see them...

Turnstone

The turnstone does just that - turns stones to find insects to feed on. Turnstone travel from Arctic Canada to winter at Morecambe Bay, where they take advantage of abundant food and look for undisturbed roosts.

Redshank

The redshank is known as the sentinel of the marsh as they loudly repeat their piping call when disturbed, notifying other birds of your presence.

Eider

The eider is the world's fastest flying duck, able to reach 55mph in level flight. Listen out for their strange cooing during courtship in spring. Your best chance of seeing eider is on the Furness Peninsula.

Knot

You'll see thousands of knot in winter when they visit this rich feeding-ground from Arctic Canada. They are known as red knot in Canada due to their brick-red breeding colour.

Lapwing

The lapwing has a slightly rubbery squeal and performs amazing aerial acrobatics in spring.

Curlew

The curlew has a long downwards-curving bill. In spring and summer listen out for its beautiful melodic song.

Shelduck

Unlike other ducks, both male and female shelduck have the same colouring - a dark green head and neck, a chestnut belly stripe and a red bill. They like to nest in old rabbit burrows.

Sanderling

The sanderling is often busily chasing the line of the tide in and out and capturing food between breaking waves. They do a good imitation of a clockwork toy!

What a site to see!

Morecambe Promenade and Stone Jetty

The many rocky breakwaters, skears and groynes stretching out from the Prom provide fantastic high tide roosts. You'll see birds here throughout the year, and in larger numbers in the colder months.

Middleton

Potts Corner at Middleton is known for its impressive display of knot and dunlin, which perform twists and turns in the air as they flock together. These displays are called murmurations. They happen when birds are looking for roosts sites after a high tide. Murmurations are best seen between December and March.

Oystercatcher

Despite its name an oystercatcher's diet consists mainly of cockles and mussels. The oldest recorded oystercatcher was 46 years old. Their bills grow continuously throughout their long lives to make good the wear and tear of chiselling into cockles and mussels.

Roost Sites

Visit a roost site between September and March when you'll see large numbers of birds gathering. Roost sites are marked on the map.

Top Tips

Look high and low!

You may see birds flying or scuttling across the mud flats.

Hello, can you help me?

If you see a birdwatcher talk to them! They will share their sightings and knowledge.

Zoom in!

You can see birds with the naked eye but you can get up close and personal with a pair of binoculars.

Listen!

Each bird has its own sound or call. You can often hear the difference between them.

Be sure to check out the tide times at tidetimes.org.uk
